

COMPUTER CASING

ABSTRACT OF THE DISCLOSURE

A computer casing having a front board, a back board, a bottom board, a top board, a left side board and a right side board, includes an internal space and a supporting structure. The internal space is used for mounting a mother board, a CPU, a heat dissipating device and plural electrical elements therein. The supporting structure is mounted on the bottom board corresponding to a position of the CPU and the heat dissipating device. In which the supporting structure is a hollow space having a stronger structural intensity than other part of the bottom board. The hollow space has four pillars protrudently mounted at four corners of the hollow space respectively for screwing and fixing the heat dissipating device thereon. Accordingly, the hollow space is employed for strengthening the structural intensity so that the bottom board can hold the CPU and heat dissipating stably without being caved in.
